NOW-THE SUPER HOT LINE

Steroids-H3 for use in competitive protein binding

First on the market with tritiated oestradiol of ultra-high specific activity, The Radiochemical Centre has now extended this product line with tritiated cortisol and tritiated testosterone at specific activities of the order of 100Ci/mmol.

All three compounds are labelled in four positions:

Oestradiol-2,4,6,7-H3(n) ........ TRK.322
Cortisol-1,2,6,7-H3(n) ............ TRK.407
Testosterone-1,2,6,7-H3(n) .... TRK.402

Further details of these and other tritiated steroids at very high specific activities will be found in our 1972/73 Radiochemicals catalogue.

Prices are most competitive—and, as with every purchase from The Radiochemical Centre, there is the added value for money of assistance and advice from our technical staff.

An authoritative monograph 'Determination of steroid hormones' is published by The Radiochemical Centre. Copies are available free on request.

The Radiochemical Centre  Amersham  England
For 3':5'-cyclic AMP Derivatives no other firm can be as helpful as SIGMA!

The first commercial Adenosine 3':5'-cyclic Monophosphate was offered by Sigma over 10 years ago. We produced it very laboriously by the alkaline hydrolysis of ATP with about a 2% yield. Cost was about $500/gram. Today we offer our No. A 9501 for less than $20/gram in 25 gram packages, and with a purity of about 99%.

Sigma also offers some related AMP Derivatives that are pretty good (we think):

Some researchers wanted to assay micro levels of 3':5'-cyclic AMP, so we have prepared small amounts of Protein Kinase (3':5'-cyclic AMP Dependent) and Protein Kinase Inhibitor per A. Gilman, Proc. Natl. Acad. Sci., 61, 305 (1970).

Since "Little Sigma" isn't properly equipped as yet, we had to get the cooperation of an outside lab to assay these products for us. We were told that 1 microgram of Protein Kinase AMP Dependent, Lot 22S-8540, will bind about 0.05 picomoles (10^-12 mole) of 3':5'-cyclic AMP at 0°C at pH 4.0. By adding the inhibitor, the binding is doubled.

It’s a Pleasure Doing Business With Sigma.

POLYACRYLAMIDES

For Enzyme Insolubilization

Use ENZACRYLS® to insolubilize YOUR . . .

- Enzymes
- Proteins for affinity chromatography and radioimmunoassay
- Hormones
- Other naturally occurring materials

There are five Enzacrlys® which can be coupled six different ways to meet your individual needs. Enzacrlys® offer the widest variety of functional groups for binding of any solid support. This wide selection of insoluble supports offers you greater stability, maximum activity and economy. Enzacrly® AA has been used as the support in developing a solid-phase radioimmunoassay for estrogens. Several time-consuming and error-producing steps were eliminated by using the solid phase method.1

Detailed experimental conditions for coupling Enzacrlys® to proteins are available on request.

PDT disulfonate

3-(2-PYRIDYL)-5,6-DIPHENYL-1,2,4-TRIAZINE-P,P’-DISULFONIC ACID, DISODIUM SALT TRIHYDRATE

PDT disulfonate is a new, highly sensitive, color reagent1 for the spectrophotometric determination of serum iron. A stable, water-soluble magenta complex is formed when PDT disulfonate reacts with divalent iron between pH 4 and 9. The visible absorption spectrum of this ferrous complex is characterized by a single absorption maximum at 562 nm, with a molar absorptivity of 27,900.1

More recent work2,3 on direct (no protein precipitation) and indirect (with protein precipitation) assays using PDT disulfonate has confirmed the precision and accuracy of the method. The high sensitivity of this reagent and its use for the determination4 of submicrogram levels of serum iron make PDT disulfonate a potentially good chromogen for automated continuous instrumental analysis of biological fluids.
