WANTED
—an Automatic Enzyme System that prepares samples precisely, makes kinetic measurements, requires no tedious pipetting, has wavelengths other than just 340 nm, provides a choice of operating temperature . . . . . . . . . . . . ! This description fits the PYE UNICAM AC1800 Automatic Enzyme System exactly. It includes one of the most wanted UV Spectrophotometers—the SP1800. This system will cost you far less to secure than some dedicated instruments with lower performance.

REWARD
from using the AC1800 system can be very worthwhile—just request more information now on our Automatic Enzyme Analyser

A **Systematic approach to chromatography**

**All components for complete systems**

Pharmacia Fine Chemicals offers a wide range of compatible components for a variety of gel filtration and ion exchange chromatographic systems.

**A** COLUMNS. A comprehensive range of jacketed and unjacketed columns available in diameters from 0.9 to 21.5 cm. Lengths from 15 to 100 cm. Special solvent resistant columns also available in diameter 2.5 cm. Lengths 45 and 100 cm.

**B** FLOW ADAPTORS. Permit upward flow elution, sample application, recycling, flow reversal, etc.

**C** VALVES. 3- and 4-way valves allow easy operation and flexibility for sample application, recycling, flow reversal, by-pass, etc.

**D** RESERVOIRS. Bi-functional gel and eluant reservoirs for column packing and elution at constant pressure.

**E** CONNECTORS. 2- and 3-port connectors for capillary tubing allow easy interconnection of chromatographic components without flanging or flaring.

**F** FLOW CONTROL VALVE. Designed for shut-off as well as flow control.

**NEW**

**Jacketed columns** with new design. Diameters 1.6 and 2.6 cm (K16 and K26). Lengths 40, 70 and 100 cm. Special 1.6 x 20 cm column for ion exchange chromatography.

**Flow adaptors** for 1.6 and 2.6 cm columns (A 16 and A 26).

**Flow control valve** (FCV-1). Standard on 1.6 and 2.6 cm columns.

When your sample requirements are 5µl or less, a small error in precision can cause a large error in your test result. To eliminate this problem the ULTRA-MICRO SAMPLERS® are individually calibrated at either 1, 2, 3, 4 or 5µl and all are guaranteed to work with a precision of ±1%.

The procedure is easy, time saving and reproducible:
A fine-bore barrel and plunger system draws material into a disposable inert fluoroplastic (FEP) tip. The tip is the only part of the instrument that comes in contact with the sample, and it is discarded after each use to completely eliminate cross-contamination.

Some areas of application for the ULTRA-MICRO SAMPLER®:

- Radio isotope sampling
- Radial Immunodiffusion
- Kinetic enzyme assays
- Fluorescent Antibody techniques
- Immunoelectrophoresis
- Toxicology
- Virology (tips may be sterilized)
- Tissue Cultures
- Sample spotting (T-L-C)
- Platelet counts

If your work involves any of the above procedures or you are having problems sampling in the 1 to 5µl range, the ULTRA-MICRO SAMPLER® will help you.

Now Available from ALDRICH CYTOCHALASINS A, B and E Versatile Tools for CYTOTOLOGICAL RESEARCH

Since their discovery in 1964 in the laboratories of the Pharmaceuticals Division of Imperial Chemical Industries Limited, the CYTOCHALASINS (Greek cytos, cell; chalasis, relaxation) have become increasingly important as research probes in cytology. These CYTOCHALASINS, a group of structurally related fungal metabolites (CYTOCHALASIN A and B from Helminthosporium dematioides, CYTOCHALASIN E from Rosellinia necatrix), share a number of unusual, interesting and characteristic biological effects, though varying greatly in potency in certain aspects. To date, CYTOCHALASIN B has been used in the vast majority of reported experiments.

Major biological effects observed with the CYTOCHALASINS include:

1. Inhibition of the division of cytoplasm. Total inhibition of cytoplasmic cleavage is obtained without interference with division of the nucleus, resulting in binucleate cells. If cultured cells are allowed to remain in the active medium, nuclear division continues and large multinucleated cells are observed.

2. Reversible inhibition of cell movement. When moving cells on a glass surface are treated with CYTOCHALASIN B, peripheral and internal cell movements disappear, but are readily restored by washing the cells with normal medium. This effect is best observed by time-lapse cinematographic studies.

3. Induction of nuclear extrusion.

In this very interesting phenomenon, it is remarkable that a cell can be induced to entirely eject its nucleus within minutes of treatment with a chemical compound. Most noteworthy is the fact that CYTOCHALASIN E rarely produces nuclear extrusion. However, it is unique in producing a "halo" around the nucleus.

The CYTOCHALASINS also exert inhibitory effects on the following biological processes: phagocytosis; platelet aggregation and clot retraction; glucose transport; thyroid secretion and release of growth hormone.

Space does not allow us to cite well over one hundred references from the literature, but a data sheet and comprehensive bibliography on the CYTOCHALASINS are available upon request. Continued research on these interesting compounds will undoubtedly uncover new effects and help elucidate their hitherto unknown mechanism of action.
