IF YOU MAKE YOUR OWN DNA LIGASE, I CAN SAVE YOU A LOT OF TIME.

I know you have enough to think about, without having to prepare your own molecular biochemicals.

I'm Dr. Mary Ann Gauch for Miles Research Division. Because your time is better spent observing and recording results, we at Miles have made some important additions to our line of molecular biological products.

To our group of individual RNA species and RPC-6, we've added two Leucine RNA species, 1 and 4, Lysine RNA and RPC-6. The components for protein synthesis studies, ribosomes, Poly U and viral ribonucleic acids, now includes Elongation Factors G and T. We've also expanded our DNA repair reagents, DNA polymerase, ML DNA, T2 DNA and øX 174 DNA, to include DNA Ligase, Polynucleotide Kinase and Amino Acyl-RNA Synthetase.

You'll find these new products offer many advantages, such as level of purity and specificity as shown in the Chemical Credentials which we will send you on request.

For the credentials and catalog describing our molecular products, or if you need help with a problem, send this coupon or call our closest office.

Send me your catalog for Molecular Biological Products and complete credentials on the following products.

Which?

Ion Exchanger • Column • Gradient Mixer

SEPHADEX® ION-EXCHANGERS
Two anion exchangers and two cation exchangers cover the whole range pH 2–12. High capacities for proteins, polynucleotides and other biopolymers MW 1000—200,000 are ensured as each ion-exchanger type is available in two porosities. 1 gram protein can be fractionated on a 30 ml bed of DEAE-Sephadex A-50 using only 10% of its available capacity.

PHARMACIA COLUMNS
Fast separations using columns of the K15 and K16 series exploit to the full the high capacities and superior resolution of Sephadex ion-exchangers. Columns K 16/20 and K 15/30 are particularly suitable for bed volumes up to 40 or 50 ml. Thermostat jacket and flow control valve are standard on the K16 columns.

PHARMACIA GRADIENT MIXER GM-1
The prime requirement for the production of linear ionic strength gradients is efficient mixing of the components of the gradient. In the Pharmacia Gradient Mixer GM-1 this is achieved by a blade configuration which lifts the dense incoming solution from the bottom of the mixing chamber and distributes it evenly throughout the whole eluant at a low stirring speed. Gradients in aqueous and most organic solvents can be formed with the GM-1.

Used together, Sephadex ion-exchangers and apparatus from Pharmacia Fine Chemicals provide practical chromatographic systems capable of the highest resolution in the ion-exchange chromatography of biopolymers.

Cyclic A-3':5'-MP assays are now within easy reach of everyone

By using the Boehringer Mannheim Test Combination for the determination of Cyclic A-3':5'-MP in the range of 1–20 p mole.

All reagents and materials required for 40 tests conveniently at hand in the Test Combination form — saves you valuable experimental time spent preparing and checking reagents.

Buffers, standards and binding protein all quality controlled to ensure correct — you will have confidence in the reagent concentrations results you obtain.

PRINCIPLE — The Gilman Test¹
The assay is based on the radio isotope dilution principle and involves the binding of A-3':5'-MP by a protein kinase. Upon addition of a known quantity of (tritium) labelled cAMP to the sample the 'cold' cAMP of the sample competes with the added 'hot' cAMP for binding to the protein. The more cAMP present in the sample, the smaller is the amount of labelled cAMP bound to the protein. The protein is retained on a special type filter (included in the test pack) and the radioactivity is measured in a liquid scintillation counter. The accurate cAMP content is obtained from a linear standard curve.

Cytochalasin (Greek CYTOS, cell; CHALASIS, relaxation)

Since their discovery in 1964 in the laboratories of the Pharmaceuticals Division of Imperial Chemical Industries Limited, the CYTOCHALASINS (Greek cytos, cell- chalasis, relaxation) have become increasingly important as research probes in cytology. These CYTOCHALASINS, a group of structurally related fungal metabolites (CYTOCHALASINS A and B from Helminthosporium dematioidem, CYTOCHALASIN E from Rosellinia necatrix), share a number of unusual, interesting and characteristic biological effects, though varying greatly in potency in certain aspects. To date, CYTOCHALASIN B has been used in the vast majority of reported experiments.

Major biological effects observed with the CYTOCHALASINS include:

1. Inhibition of the division of cytoplasm. Total inhibition of cytoplasmic cleavage is obtained without interference with division of the nucleus resulting in binucleate cells. If cultured cells are allowed to remain in the active medium, nuclear division continues and large multinucleate cells are observed.

2. Reversible inhibition of cell movement. When moving L cells on a glass surface are treated with CYTOCHALASIN B, peripheral and internal cell movements disappear, but are readily restored by washing the cells with normal medium. This effect is best observed by time-lapse cinematographic studies.

3. Induction of nuclear extrusion. In this very interesting phenomenon, it is remarkable that a cell can be induced to entirely eject its nucleus within minutes of treatment with a chemical compound. Most noteworthy is the fact that CYTOCHALASIN E rarely produces nuclear extrusion. However, it is unique in producing a "halo" around the nucleus.

The CYTOCHALASINS also exert inhibitory effects on the following biological processes: phagocytosis; platelet aggregation and clot retraction; glucose transport; thyroid secretion and release of growth hormone.

Continued research on these interesting compounds will undoubtedly uncover new effects and help elucidate their hitherto unknown mechanism of action. Space does not allow us to cite well over one hundred references from the literature, but a data sheet and comprehensive bibliography are available upon request. The CYTOCHALASINS are made in England by Imperial Chemical Industries Limited and distributed by the Aldrich Chemical Company.
