The MSE Centriscan 75 is no compromise; it combines full preparative and analytical facilities — one centrifuge to buy instead of two. On the analytical side it is capable of work of the highest precision and sensitivity, recording absorbance of up to four samples in the same rotor. The optical system is a unique form of split-beam scanner operating down to 254nm and scans are drawn directly on a recorder — no cameras! A simple changeover converts the instrument to refractometric scanning and permits the recording of Schlieren diagrams. On the preparative side, 75,000 rpm gives 500,000 x ‘g’ — and unique versatility. Ask now for Publication No. 501

IF WE DON'T HAVE THE BLOOD PROTEIN YOU NEED...TELL US WHAT IN THE WORLD YOU DO NEED...

At Miles Research, we have blood proteins—from bovine to sperm whale, and just about everything in between. So, chances are we already have just the blood protein you need. Of course, we also have the resources to supply specialized products to meet your requirements. To succeed, we need your suggestions. Our full line of blood protein products are described in our new catalog. We'd like to send you a copy and, then, hear from you about your special needs and to learn about your specific uses for blood proteins. You can reach me and other members of our staff here in Kankakee, Illinois, U.S.A., by telephoning (815) 839-4417. Or, simply return the coupon to any of our sales offices.

Call SIGMA for
FERREDOXIN-TPN REDUCTASE

Ferredoxin-TPN reductase is an FAD containing enzyme which catalyzes the reversible electron transfer between Ferredoxin and TPN in photosynthesis. This enzyme also catalyzes the dehydrogenation of TPNH with various electron acceptors, e.g. dyes, and ferricyanide (diphosphorase activity).

Recently, the Ferredoxin/Ferredoxin-TPN reductase system has been reported as a powerful agent for reducing normal and abnormal hemoglobin. This same system was also found to reduce the heme iron of spin-labeled hemoglobin selectively without destroying the attached spin labels.2

SIGMA offers this enzyme. Product No. F 0628, from Spinach, Lyophilized.

**ACTIVITY**: 1 mg will reduce approx. 1.5 μ Moles of TPN per minute at pH 7.6 at 25°C. In the presence of
Treated Chloroplasts, Ferredoxin, 2,6-Dichlorophenol indophenol, L-Ascorbic Acid and TPN.

1 unit $3.84
10 units $28.50

Native Diphosphorase Activities: 2,3 (TPNH) — Approx. 15 units/mg. Beta-Hematin — (β-DPNH) — Approx. 0.2 unit/mg.
One unit Diphosphorase will oxidize one μ Mole of β-DPNH or TPNH per minute at pH 7.6 at 25°C using 2,6-Dichlorophenol Indophenol.

**C.I.F. Destination Anywhere in the World Via Air**

Also available from SIGMA:

**FERREDOXIN**

F 5876 Type III: from Spinach.
1 mg. £ 8.10
10 mg. £24.45

F 3260 Type I: from Ch. Pasteurianum.
5 mg. £16.50
10 mg. £25.33

These Ferredoxins are frozen buffered solutions. Prices include dry ice, Insulated container, and shipment via Air
within Continental U.S.A. Shipped F.O.B. St. Louis via Air Freight to Hawaii, Alaska and other countries.

**P 0762 PHOSPHATASE-ALKALINE**

Insoluble. From Clostridium Mucoides. Attached to beaded Agarose. Suspension in 2.0 M (NH₄)₂SO₄, 0.001 M MgCl₂, 0.0001 M CaCl₂, pH 7. Activity: One mg will hydrolize 34 μ Moles of p-Nitrophenyl Phosphate per minute at pH 10.4 at 37°C. Substantially RNAe and DNAe free.

8 units £ 3.31
26 units £ 11.04

**C 7511 CONCANAVALIN A**

ON BEADED AGAROSE

Insoluble. A suspension in 1.0 M NaCl. Contains approx. 300 mg. of Concanaavalin A per gram of agarose. One mg. Concanaavalin A will complex with approx. 0.2 mg. of Yeast Mannan at pH 7.2 at 25°C.

10 mg. £ 1.81
1 g. £ 60.87

**A 2137 ARGINASE**

(L-Arginine ureohydrolase; E.C. No. 3.5.3.1) Lyophilized powder from Bovine Liver. Activity: One mg will convert approx. 40-60 μ Moles of L-Arginine to Ornithine and Urea per minute at pH 9.5 at 37°C. Similar to Product No. 4631 (discontinued) but with approx. double the activity.

2,500 units £ 1.21
25,000 units £ 12.25

**E 0878 ENDOPEPTIDASE**

Bacterial, crude powder. Activity: One mg. solid will produce a ΔOD₅₄₀ of 20 per five minutes at pH 9.0 at 37°C, when measuring TCA soluble products from denatured Hemoglobin in a final volume of 16 ml. (1 cm. light path).

250 mg. £ 1.44
5 g. £ 13.25

**S 0754 SUPEROXIDE DISMUTASE**

From Bovine blood. Frozen solution in Potassium phosphate buffer, pH 7.4. Activity: Approx. 0.35 μ gmoles will cause a 50% inhibition of the reduction of Ferricytochrome C by Xanthine Oxidase in a reaction mixture containing 0.00001 M Ferricytochrome C, 0.00005 M Xanthine, 0.0001 M EDTA, and sufficient Xanthine Oxidase to produce a decrease in A₂₅₀ of 0.025 per minute at pH 7.8 at 25°C. In a reaction volume of 3.0 ml. Shipped in dry ice.

1 mg. £ 9.50
5 mg. £ 31.30
10 mg. £ 53.00

Prices include dry ice, Insulated container and shipment via Air within the continental United States excluding Alaska. Shipped F.O.B. St. Louis via Air freight to Hawaii, Alaska and all countries other than the United States.

3 different columns in one!

It's the new Whatman Multi-system - 3 different columns in one. How's it done? By using Whatman's unique interchangeable sealing pistons in one very durable glass column. Polypropylene pistons are fitted standard for ion exchange celluloses and most organic solvents, polyamide mesh is available for gel filtration and PTFE for difficult organic and acid solvents. So you don't have to buy lots of separate columns-just select the appropriate sealing piston. And as end units are identical, chromatography can be ascending or descending. Multi-system is made to the high standards of precision you'd expect from Whatman and incorporates their sample input/delivery system to ensure homogenous loading. Multi-system is designed for easy use, versatility and durability. It offers high accuracy in a full range of column chromatography systems without replication-all at a reasonable cost.

New Whatman Multi-system- the cleverest column in chromatography!

Boehringer Mannheim have DNA Polymerase I that you can rely upon in every way. For convenience of use the enzyme is supplied in 50% glycerol in a polypropylene vial that can be kept happily at 20°C during shipment and storage.

Our Grade I preparation with a specific activity of 2500-5000 U/mg corresponds to stage 7 of the Jovin et al. preparation. Before it leaves our Research Laboratories in Tutzing it undergoes exacting quality control procedures including SDS disc electrophoresis which shows just one heavy and a few very faint bands.

A fragment of the DNA Polymerase I enzyme—Enzyme A according to Klenow—is the latest addition to our range. It has a molecular weight of only 75,000, as opposed to 109,000 for the DNA Polymerase I, due to the removal by proteolytic activity of the 5'→3' Exonuclease.

DNA Polymerase is no exception to the Boehringer Mannheim dictum that for each enzyme its own substrate, co-factor and inhibitor is supplied. Examples from the range of complimentary biochemicals available for DNA Polymerase I are deoxytriphosphates including 5'-bromo dUTP, Nalidixic acid and Poly(dG-dC).—Analytical specifications and applications for these and the complete range of our biochemicals for Molecular Biology and Structural Studies are in these illustrated brochures.
