THE HYDROPHOBIC EFFECT: Formation of Micelles and Biological Membranes 2nd Ed.
by C. Tanford, Duke University
This edition gives a simple explanation for the formation and properties of biological membranes. It includes the theoretical treatment of micelle formation, making it possible to predict (from first principles) the size and size distribution of micelles formed by many simple amphiphiles, as well as the critical concentration at which they first form.
February 1980 246 pages 0471 04893 3 $24.65/£11.25

BACTERIAL OUTER MEMBRANES: Biogenesis and Functions
edited by M. Inouye, State University of New York, Stony Brook
This is the first book which encompasses the wide areas of outer membrane research. It illustrates the dynamic aspects of the outer membrane, including how its individual constituents are synthesized and assembled in the outer membrane and how they function.
April 1980 544 pages 0471 04676 0 $66.50/£30.35

NMR SPECTROSCOPY: An Introduction
by H. Günther, Professor of Organic Chemistry, University of Siegen, West Germany;
Translated by R.W. Gleason, Professor of Chemistry, Middlebury College, Vermont, USA
The book deals with the principles of NMR spectroscopy and its applications to organic chemistry. The main subject is proton NMR, with chapters devoted to carbon and fluorine NMR.
April 1980 450 pages 0471 27580 8 (cloth) $64.80/£22.50
0471 27579 4 (paper) $23.00/£7.95

TOPICS IN ANTIBIOTIC CHEMISTRY Vol. 3:
Mechanisms of Action of Nalidixic Acid and Its Congeners; New B-Lactam Antibiotics
edited by P.G. Sammes, University of Leeds
The first of the two reviews in the book surveys nalidixic acid and its congeners, reports current ideas on how these drugs act, and suggests areas where further work is needed. It includes original data on these compounds.
The second review gives the first comprehensive survey on the penicillin and cephalosporin antibiotics.
January 1980 204 pages 085312 139 7 $48.95/£18.50
Published by Ellis Horwood Ltd., Chichester

TOPICS IN ANTIBIOTIC CHEMISTRY Vol. 4 The Chemistry and Antimicrobial Activity of New Synthetic B-lactam Antibiotics
edited by P.G. Sammes, Department of Organic Chemistry, University of Leeds
This volume of the series is devoted entirely to the B-lactam antibiotics on account of the sheer bulk of current research in the area. Emphasis is placed here on the chemical nature of the B-lactam antibiotics, and the microbiological activity of recently-developed synthetic analogues as compared with naturally-occurring materials.

What's new with tritiated thymidine?

- A wide choice of specific activities from 2-100 Ci/mmol
- A choice of solvent in most cases; aqueous solution or aqueous solution containing ethanol
- A wide choice of position of the label — in every case the specificity of labelling has been checked by nmr

All our batches are purified by HPLC ensuring consistently high purities and good stability.

Amersham also supplies the hottest [U-14C]Thymidine — our current batch is at 559 mCi/mmole.

For the best range of labelled thymidines — call Amersham

SPECIAL PUBLICATION No. 5

Safety in Biological Laboratories

Edited by E.F. HARTREE and V.H. BOOTH

68 pp + xii ISBN 0904498 05 0 £1.60 (U.S. $ 3.00)

A concise, easily readable guide for workers in Life-Science Laboratories. Emphasis is on SAFETY rather than DANGER, on avoidance of risks, elimination of hazards, and on the need for safety consciousness for the benefit of others as well as the worker’s own person. Among topics discussed are radiation, animals, pathogens, carcinogens and other dangerous substances, vacuum distillation, fire and electricity as well as such simple operations as emptying autoclaves and connecting plastic tubing to glass tubing. The booklet is intended for all who work in laboratories, from the newest assistant to the head of department (who may come to realize that some of their standard practices contain avoidable elements of danger). Generous discounts are offered for bulk purchase: 6—10 copies, less 10%; 11—20 copies, less 20%; 21—50 copies, less 30%; 51 copies or more, less 40%.

The booklet should help every reader to be more likely to survive and to pass on the message: SAFETY IN BIOLOGICAL LABORATORIES

Obtainable from your bookseller or agent, or direct from

SYMPOSIA SERIES No. 44

Biochemistry of Genetic Engineering

Edited by P. B. Garland and R. Williamson

pp. 145 (ISBN 0 904498 08 5) £12.50 (US$27.50)

A Biochemical Society Symposium held in London in July 1978

The Biochemical Society’s Forty-Fourth Symposium held at University College London in July 1978 reviewed in a two day meeting the exciting and rapidly expanding area of Genetic Engineering. Leaders in the field gave general introductions to the biochemical basis, practice and aims of many aspects of the subject, illustrated with accounts of current research. Subjects included ranged from the enzymology of restriction nucleases, ligases and polymerases, proceeded through vectors and hosts for recombinant DNA, considered in depth selected plant and animal systems, and concluded with industrial prospects and social perspectives. These excellent and well-received presentations form the basis of this publication, which will serve not only as a readable introduction to the biochemistry of genetic engineering but also as a valuable account of the activities of a number of leading laboratories as of summer 1978.

List of contents and authors:

Preface.

Restriction Nucleases, Ligases and Polymerases in Genetic Manipulation by A. D. B. Malcolm.

Safe and Useful Vector Systems by W. J. Brammar.

Plasmid Vectors for Genetic Manipulation in vitro by D. J. Sherratt.

Analysis of Restriction-Fragment Patterns from Complex Deoxyribonucleic Acid Species by E. M. Southern.

Primary-Sequence Changes in the Differentiation of Immunoglobulin Genes by T. H. Rabbitts.

SV40 and Polyoma Viruses: their Analysis by Deoxyribonucleic Acid Recombination in vitro and their Use as Vectors in Eukaryotic Systems by P. W. J. Rigby.

Genetic Manipulation Advisory Group (GMAG) and the Environment for Genetic Engineering in Britain by R. Williamson.

Genetic Engineering: Do We Need It? How Would We Do It? by A. J. Hale.

Vinblastine and Vincristine

Antitumor Alkaloids for Cancer Research

Known as Vinca alkaloids, vinblastine and vincristine are isolated from the plant *Vinca rosea* Linn. and exhibit antimitotic and antineoplastic activity. It has been suggested that the antineoplastic action of these alkaloids is a result of their antimitotic effects.

**Vinblastine sulfate**

Vinblastine has been shown to be an effective antineoplastic agent. It is well known that the compound disrupts cell spindles, binds to the microtubule protein, tubulin, and inhibits microtubule assembly. Vinblastine also induces tubulin to self-assemble into coiled and tubular structures. Na and Timasheff recently reported detailed sedimentation and thermodynamic studies on vinblastine binding to tubulin and the vinblastine-induced self-association of tubulin.

Other pharmacological effects of vinblastine include autophagocytosis, alteration of secretory granules, dibutyryl cAMP-mediated discharge of protein components, decrease of glucose uptake, and lowering of ocular pressure.

Vincristine sulfate

Vincristine is also very useful in cell studies involving its inhibitory effects on mitosis. Like vinblastine, it is becoming increasingly important as a chemotherapeutic tool in cancer research.
