BIOSYNTHESIS OF NATURAL PRODUCTS

by **P. Manitto**, *Professor of Organic Chemistry, Faculty of Science, University of Milan*

This comprehensive introduction to the intricacies of metabolism in plants and animals shows the means by which nature employs simple and complex organic compounds to generate the rich and powerful store of natural products.

The author surveys the field carefully and thoroughly, preceding each topic by an introductory section, followed by complete in-depth explanations, and a wealth of diagrams illustrative of the text. Research methods and techniques are probed, as well as isotopic tracer methods and the administration of labelled substrates.

MEDICINAL CHEMISTRY VI: Proceedings of the 6th International Symposium on Medicinal Chemistry, Brighton, U.K., September 1978

edited by **M.A. Simkins**

The three Plenary Lectures published in this volume represent the ideas of eminent men, two of them Nobel Laureates. Dr. Pauling speaks of a new concept in therapy, that of orthomolecular medicine. Sir John Cornforth proposes a greater awareness of the structural characteristics of enzymes while Sir Arnold Burgen shows how modern techniques can determine our understanding of receptors.

TOPICS IN BIOELECTROCHEMISTRY AND BIOENERGETICS, Vol. 4

edited by **G. Milazzo**, *Istituto di Chimica della Facolta di Ingegneria, Universita di Roma, Italy*

This series gathers together reviews of topics concerned with energy transduction and electrochemical processes in biological systems, and techniques for their investigation. The volumes of the series will include discussions of fundamental biochemical mechanisms of such processes as phosphorylation, photosynthesis, electron and ion transport, various metabolic redox reactions, membrane phenomena, certain pharmacological and pharmacodynamical properties, and transmission of information at cellular level.

SYMPOSIA SERIES No. 45

The Lymphocyte Cell Surface

Edited by **P. B. Garland** and **M. J. Crumpton**

pp. 124 (ISBN 0 904498 10 7) £15.00 (US\$35.00)

A Biochemical Society Symposium held in Cambridge in June 1979

The Biochemical Society's Forty-fifth Symposium held at Cambridge in June 1979 dealt with two areas of biomedical research currently regarded as among the most exciting and clinically important research interests: the molecular mechanics of the immune response and the biochemistry of the cell surface. Speakers at the Symposium reviewed results from this work and in addition gave emphasis to those research aspects providing greatest promise in future work with the lymphocyte. A number of the major contributions to the Symposium form the basis of this publication.

Preface

A Calcium Hypothesis for the Control of Cell Growth

by **J. C. Metcalfe, T. Pozzan, G. A. Smith & T. R. Hesketh**

Cell-Surface Antigens of Lymphocytes: Markers and Molecules

by **A. F. Williams**

Structural Similarities Between Thy-1 Antigen from Rat Brain and Immunoglobulin

by **D. G. Campbell, A. F. Williams, P. M. Bayley & K. B. M. Reid**

The Motor of Amoeboid Leucocytes

by **T. P. Stossel, J. H. Hartwig, H. L. Yin & O. Stendahl**

Contact-Induced Modification of Lymphocyte Morphology

by **L. Wanger & K.-G. Sundqvist**

Functional Studies on Receptor Complexes of B-Lymphocytes Involved in Regulation of Growth and Maturation

by **F. Melchers, J. Andersson, W. Lernhardt & M. H. Schreier**

BIOSCIENCE REPORTS

Communications and Reviews in Molecular and Cellular Biology

Published by The Biochemical Society

BIOSCIENCE REPORTS is a new international monthly journal devoted to the rapid publication of high-quality papers that advance new concepts in the areas of molecular and cellular biology. Review articles and other topical material will be included from time to time.

Hon. Advisory Editors:

A. KORNBERG
R. R. PORTER
F. SANGER

Board of Editors: Chairman: C. A. PASTERNAK (U.K.)
Deputy Chairman: K. A. PIEZ (U.S.A.)

Call for Papers

Short reports of original research, of sufficient interest and significance to justify rapid publication, in all areas of biochemistry can be submitted directly to any member of the Board of Editors. Publication will be within approximately 2 months of receipt. Instructions to authors for *Bioscience Reports* with the addresses of all Editors are available from The Biochemical Society, 7 Warwick Court, London WC1R 5DP.

9-Fluorenylmethyl chloroformate

Amino-Protecting Reagent for Peptide Synthesis

For several years we have been offering BOC-ON¹ and di-*tert*-butyl dicarbonate² as reagents of choice for *t*-Boc amine protection in peptide synthesis. Both reagents react simply

and rapidly with amino acids to provide protected derivatives in excellent yields.

9-Fluorenylmethyl chloroformate (Fmoc-Cl) provides an alternative to *t*-Boc amine protection. In recent studies, 9-fluorenylmethoxycarbonyl (Fmoc)^{3,4} was shown to be an

effective protecting group in solid-phase peptide synthesis^{5,6} and in the protection of amino acids in solution.⁷ Derivatization with Fmoc-Cl gives a base-labile protected amino acid which can be cleaved by liquid NH₃ and mild bases such as piperidine, piperazine, and cyclohexylamine.

Amino acid derivatization

Fmoc protection of α -NH₂ groups in solid-phase peptide synthesis eliminates the need for repetitive acidolysis for α -NH₂ deblocking, allowing rapid and quantitative deprotection.⁶ In addition, it eliminates the cleavage step with liquid HF, a hazard and a known source of side reactions.

Deprotection and monitoring

Fmoc protection is compatible with *tert*-butyl-type amino acid side chains,⁸ and has been shown to improve the yield of test peptides^{6,9} and β -endorphin.¹⁰ It has also been used successfully in the solid-phase synthesis of dehydrosomatostatin.⁵

Synthesis using Fmoc protection gives the peptide chemist a new dimension in flexibility. Barany and Merrifield have shown that Fmoc protection is particularly well-suited to orthogonal systems.¹¹

Depending upon your particular synthesis problem, Fmoc protection could well improve the yield and quality of your peptide products. Fmoc-Cl shortens the synthesis time required by other protection strategies and simplifies peptide purification. Only one solvent is needed for deblocking, washing, and coupling, and deprotection is easily monitored by UV.

Fmoc-Cl is licensed from Research Corporation under U.S. Patents 3,835,175 and 3,906,031.
