BIOTECHNOLOGY

Edited by C. F. PHELPS and P. H. CLARKE

The fourteen contributions forming this volume were presented at a London meeting of the Biochemical Society including the Society's Forty-Eighth Symposium 'Biotechnology', in December 1982. With today's increasing pressures to develop latest laboratory findings into practical industrial processes as quickly as possible the chosen theme of this Symposium was a timely one. The papers represent up-to-date reports from international biochemists whose work is of direct relevance to the wide areas of interests concerned with biotechnology, together with glimpses of the early development of its techniques and a look at its exciting future.

Messenger RNA and Ribosomes in Protein Synthesis

Edited by C. F. PHELPS and H. R. V. ARNSTEIN

The Biochemical Society's Forty-Seventh Symposium, held in London in December 1981, assembled some of the leading workers in this area of biochemistry. The subjects for discussion were chosen for their timeliness and distinctiveness, and included accounts of ribosome and messenger RNA structure and function, initiation factors, caps and ribonucleoproteins, as well as consideration of the processes leading to the distribution of newly synthesized proteins within the cell. The papers presented are now published in this volume.

Hypoglycemic Agent and Inhibitor of Fatty Acid Oxidation

Hypoglycin (α-amino-2-methylencyclopropane proionic acid) is the toxic, hypoglycemic principle of the unripe Jamaican ackee fruit, Blighia sapida, which causes widespread disorders in the metabolic processes involving carbohydrates and lipids. 4

4-Pentenoic acid is the simplest structural analog of hypoglycin which possesses hypoglycemic activity. The compound is a potent inhibitor of β-oxidation and gluconeogenesis. 1-2 Mechanisms for both in vivo and in vitro metabolic activity of 4-pentenoic acid have been studied. 1-4

4) Iden ibid. 1978, 27, 2891.

24,592-5 4-Pentenoic acid
5g $7.00; 25g $23.40

Soluble Perylene Fluorescent Dye

The tert-butyl groups in this dye render it soluble in organic solvents; a 99% quantum yield in fluorescence is obtained.

26,422-9 N,N'-Bis(2,5-di-tert-butylnaphthyl)-3,4,9,10-
perylenedicarboximide
100mg $14.00

Cholinergic Agonists

[CH(CH)₂CO₂HCH₂NMes₃] , X = Cl, 1

Suberylcholine has been found to mimic acetylcholine, a compound which acts in the transmission of nerve impulses to excitable membranes. Thus, suberylcholine is a useful tool for studying the conductance properties of the acetylcholine receptor channels of biological membranes. 1-4

86,204-5 Suberylcholine dichloride 1g $19.75; 5g $65.85
86,211-8 Suberylcholine diiodide 5g $14.85; 25g $49.50

Membrane Protein Solubilizing Agent

3-{[Cholamidopropyl]dimethylammonio}-1-propanesulfonate (CHAPS) is a zwitterionic detergent introduced as an alternate to both ionic and nonionic detergents for solubilizing membrane proteins, e.g., adenylate cyclase. 1-2 CHAPS was reported to be the only detergent to solubilize the opiate receptor of rat brain cells with retention of the reversible opiate-binding activity of the receptor. 1 CHAPS proved superior to sodium cholate and sodium deoxycholate in solubilizing bovine brain adenylate cyclase and separating the catalytic unit from the guanylnucleotide-binding protein. 3

22,694-7 3-[Cholamidopropyl]dimethylammonio]-1-
propanesulfonate (CHAPS)
1g $14.00

Luciferin Intermediate

Intermediate in the synthesis of firefly luciferin, useful in studies of firefly luciferase. 1-4

26,185-8 2-Cyano-6-methoxybenzothiazole
250mg $17.25; 1g $48.00

Fluorescent Coumarin

Useful probe for the simultaneous trace analysis of free fatty acids in blood serum.

23,530-2 4-(Bromomethyl)-7-methoxycoumarin
1g $18.90; 5g $78.75
