THE BIOCHEMICAL SOCIETY

The Biochemical Society exists to advance the science of biochemistry through meetings and publications. Several meetings a year are held, each at a different place; original papers are presented and special topics are discussed at symposia and colloquia.

OFFICERS AND COMMITTEE: 1985–1986

Treasurer
B. Spencer

Committee
M. Akhtar, F.R.S.
H. Baum
R. B. Beechey
B. Burchell*†
S. Doonan
L. A. Fothergill-Gilmore
M. D. Houslay
H. M. Keir
G. G. Lunt
M. J. Morgan
C. I. Pogson*†
P. J. Quinn

E. D. Saggerson
P. G. Strange
I. P. Trayer
E. J. Wood

Executive Secretary: G. D. Jones (7 Warwick Court, London WC1R 5DP)

Persons interested in biochemistry are eligible for election as Members. Details of further facilities accorded to Members, and forms of application for membership, are available from the Executive Secretary, The Biochemical Society, 7 Warwick Court, London WC1R 5DP [01-242 1076 (4 lines)].

BIOCHEMICAL SOCIETY SYMPOSIUM No. 50
held at St. George's Hospital Medical School, London, December 1984

The Molecular Basis of Movement
Through Membranes

ORGANIZED AND EDITED BY
P. J. QUINN AND C. A. PASTERNAK

Price £30.00 (US $55.00)

BIOTECHNOLOGY

Edited by C. F. PHELPS and P. H. CLARKE

The fourteen contributions forming this volume were presented at a London meeting of the Biochemical Society including the Society's Forty-Eighth Symposium 'Biotechnology', in December 1982. With today's increasing pressures to develop latest laboratory findings into practical industrial processes as quickly as possible the chosen theme of this Symposium was a timely one. The papers represent up-to-date reports from international biochemists whose work is of direct relevance to the wide areas of interests concerned with biotechnology, together with glimpses of the early development of its techniques and a look at its exciting future.

A New Twist in Flash Chromatography

In 1978, Professor Clark Still and coworkers reported a simple, rapid technique for the preparative separation and purification of organic compounds. Still's flash chromatography is performed with a glass column fitted with a valve so that positive pressure (usually from compressed air or nitrogen) can be applied and regulated at the top of the column. Product separations are quick and recoveries are high.

For several years, Aldrich has offered a complete line of conventional flash columns, flow controllers, and solvent reservoirs. Now we introduce a new twist in flash chromatography! Our glassblowers have replaced the ball joint and clamp with a standard taper, threaded ground-glass joint with an O-ring compression seal above the joint (see inset at right). The sealing mechanism is contained within the joint assembly, thereby eliminating the need for an external pinch clamp. No grease is required: the special design enables quick separation of the glass joints in the event they seize. The modified columns can be assembled, depressurized, and disassembled much more quickly than conventional ones. All it takes is a twist of the joint screw cap (the glass parts remain stationary). We found no loss of solvent or pressure through the new joints.

For your convenience, we have added a scale (graduated in centimeters and inches) to the modified columns. This aids in adjusting the solvent flow rate to the recommended 2 inches (5 centimeters) per minute. Note, too, the new self-extracting Teflon® stopcock.

2) Our original product line is, of course, still available.
