

Announcing the next volume in the acclaimed series

Practical Methods in Electron Microscopy

Series Editor **Audrey M Glauert**

The **Practical Methods in Electron Microscopy** series which has gained an international reputation as the unique source of practical information for all electron microscopists is now published by Portland Press.

Vacuum Methods in Electron Microscopy

by **Wilbur C Bigelow**, *University of Michigan, Ann Arbor, USA*

The latest volume in this popular series gives full details and advice on the understanding and practical operation of the vacuum systems found in electron microscope laboratories. Detailed and fully illustrated descriptions are given of:

- basic vacuum processes
- functioning of vacuum gauges and pumps
- correct operating procedures for different types of vacuum systems
- procedures for detecting and repairing leaks in vacuum systems.

This book is essential for all scientists, technicians and engineers who are responsible for the operation of vacuum systems on electron microscopes and other scientific equipment.

Extracellular Matrix!

Dermatan Sulphate Proteoglycans:

**Chemistry, Biology,
Chemical Pathology**

Edited by **John E Scott**

Dermatan Sulphate Proteoglycans brings new perspectives to extracellular matrix studies, embodying an approach to proteoglycans and glycosaminoglycans in which their function is directly linked to their chemical morphology. Dermatan sulphate proteoglycans (PDSs) are bifunctional cross-linking molecules, acting as tissue organizers. Specific interactions between PDSs and collagen fibrils, allied to glycan-glycan aggregation, produce highly organized

molecular hierarchies, with PDS playing a key role in maintaining regular ultrastructure. This book includes detailed chemical, physical chemical and electron histochemical studies, computer and biochemical models.

Biochemists, carbohydrate chemists, anatomists, pathologists, ophthalmologists and rheumatologists will be interested in this book.

Neuropeptide Gene Expression

Edited by A J Turner

Neuropeptides are a rapidly growing class of biological signal molecules. Study of their molecular biology is providing insights into important mechanisms of gene expression. In this book, leading scientists survey the recent progress made in the identification of neuropeptides and the factors regulating their expression including transcription factors, enzymes involved in post-translational processing as well as agents modulating peptide hormone release at synaptic terminals. This book will be of interest to both neuroscientists and those studying gene expression in general.

300 pages August 1994

Temperature Adaptation of Biological Membranes

Edited by A R Cossins

This book examines current knowledge of the physical/structural adaptations of membranes to fluctuations in temperature.

New genetic and molecular biology approaches to investigating the underlying machinery are presented in the book. Also included are new perspectives on mechanisms of cold and heat damage, and adaptations which endow enhanced thermoresistance.

Essential reading for anyone studying membrane structure and function: biochemists, biophysicists and physiologists, also all those interested in cold/heat tolerance.

Mitochondria: DNA, Proteins and Disease

Edited by V M Darley-USmar and A H V Schapira

Whilst the function of mitochondria in cell metabolism is well understood, the role which dysfunctional mitochondria play in human disease is just emerging, with many mutations and more diseases associated with mitochondrial abnormalities, eg mitochondrial myopathies, encephalopathies and Leber's hereditary optic neuropathy being described regularly. This book aims to bridge the gap between basic research and clinical practice by bringing together the genetic and bioenergetics aspects of mitochondrial metabolism.

The Biology of Tardigrades

by Ian M Kinchin

This is the only modern comprehensive account of marine and freshwater tardigrades. It contains the first taxonomic review for over a decade in addition to covering all aspects of their biology including • reproduction and life-history • cryptobiosis • collecting and preserving.

The Biology of Tardigrades is highly illustrated and includes an extensive list of references for further reading as well as a glossary.

It will be of interest not only to those studying tardigrades directly, but to zoologists and others who come into contact with them when studying marine or freshwater meiofauna, soilfauna and leaf litter.

Manipulating DNA: The Latest Video in The Biochemical Basis of Biology Series

E J Wood University of Leeds

The **Biochemical Basis of Biology** is a series of videotapes which complements the teaching of A-Level Biology courses, first year degree courses and vocational qualifications. This series will help teachers to illustrate biochemical facts and concepts in a dynamic way not possible with textbooks or written notes. They also allow students access to experiments which could never be demonstrated in a school laboratory. The latest video, **Manipulating DNA** looks at the latest genetic engineering techniques; including sections on • Cutting DNA • Electrophoresis of DNA • Amplifying DNA • Cloning DNA.

Membrane Protein Expression Systems

A User's Guide

G W Gould

This book is a simple-to-read laboratory manual describing the principles behind the commonly used expression systems, e.g. *Escherichia coli*, cell culture systems, *Xenopus* oocytes, baculovirus, vaccinia and yeast. Detailed experimental protocols for each system are provided in an easy-to-use, step-by-step format. The benefits and the likely pitfalls that newcomers might encounter, are discussed in each case.

Nitric Oxide: Brain and Immune System

S Moncada, G Nisticò and E A Higgs

This book contains the proceedings of the First International Meeting on Nitric Oxide: Brain and Immune System. The meeting brought together the diverse research on nitric oxide and the interaction between the brain and immune system.

Essays in Biochemistry:

Volume 28

K F Tipton

Essays in Biochemistry contains ten self-contained summaries of rapidly moving areas of biochemistry and molecular biology which are poorly covered in standard student textbooks. Topics covered include • PIG-tailed membrane proteins • The renin—angiotensin system • Protein kinase inhibitors.

Published in a new format which makes extensive use of illustrations, diagrams and tables to enhance its accessibility, undergraduates, postgraduates and lecturers will find it extremely useful.

Neurochemistry of Drug Dependence

S Wonnacott and G G Lunt

Neurochemistry of Drug Dependence brings together neurochemical information about drug targets and their mechanisms on the one hand, with psychopharmacological and behavioural studies of drug dependence on the other.

This multidisciplinary book will be useful to Biochemists, Pharmacologists and Behavioural Scientists.

Proteolysis and Protein Turnover

J S Bond and A J Barrett

Proteolysis participates in an impressive array of biological processes that includes blood clotting, tissue remodelling, nutrient acquisition, antigen processing and the mitotic cycle. In **Proteolysis and Protein Turnover** experts portray a sense of how the field is moving, highlight the important discoveries and pinpoint areas where work may benefit from collaborations.
